

YOU CANNOT USE THIS ON ANY TEST

Construct	Code Segment					
End of statement	Colons (:) are used to start a new statement					
Operators	! (not) , ^ or ↑(exponent), * (multiplication), / (real division), % (modulus), +, -, >, <, >=, <=, !=, ==, && (and), (or) in that order of precedence					
Functions	abs(x) - absolute value, sqrt(x) - square root, int(x) - greatest integer ≤ x					
Variables	Start with a letter, only letters and digits					
Sequential statements	<table><tr><td>INPUT variable</td></tr><tr><td>variable = expression (assignment)</td></tr><tr><td>OUTPUT variable</td></tr></table>	INPUT variable	variable = expression (assignment)	OUTPUT variable		
INPUT variable						
variable = expression (assignment)						
OUTPUT variable						
Decision statements	<table><tr><td>IF boolean expression THEN</td></tr><tr><td>Statement(s)</td></tr><tr><td>ELSE (optional)</td></tr><tr><td>Statement(s)</td></tr><tr><td>END IF</td></tr></table>	IF boolean expression THEN	Statement(s)	ELSE (optional)	Statement(s)	END IF
IF boolean expression THEN						
Statement(s)						
ELSE (optional)						
Statement(s)						
END IF						
Indefinite Loop statements	<table><tr><td>WHILE Boolean expression</td></tr><tr><td>Statement(s)</td></tr><tr><td>END WHILE</td></tr></table>	WHILE Boolean expression	Statement(s)	END WHILE		
WHILE Boolean expression						
Statement(s)						
END WHILE						

Construct	Code Segment			
Definite Loop statements	<table><tr><td>FOR variable = start TO end STEP increment</td></tr><tr><td>Statement(s)</td></tr><tr><td>NEXT</td></tr></table> <p>(Assume default increment is 1)</p>	FOR variable = start TO end STEP increment	Statement(s)	NEXT
FOR variable = start TO end STEP increment				
Statement(s)				
NEXT				
Arrays	1 dimensional arrays use a single subscript such as A(5). 2 dimensional arrays use (row, col) order such as A(2,3). Arrays can start at location 0 for 1 dimensional arrays and location (0,0) for 2 dimensional arrays. Most ACSL past problems start with either A(1) or A(1,1). The size of the array will usually be specified in the problem statement.			
Strings	<p>Strings can contain 0 or more characters and the indexed position starts with 0 at the first character. An empty string has a length of 0. Errors occur if accessing a character that is in a negative position or equal to the length of the string or larger. The len(A) function will find the length of the string which is the total number of characters. Strings are identified with surrounding double quotes. Use [] for identifying the characters in a substring of a given string as follows:</p> <p>S = "ACSL WDTPD" (S has a length of 10 and D is at location 9)</p> <p>S[:3] = "ACS" (take the first 3 characters starting on the left)</p> <p>S[4:] = "DTPD" (take the last 4 characters starting on the right)</p> <p>S[2:6] = "SL WD" (take the characters starting at location 2 and ending at location 6)</p> <p>S[0] = "A" (position 0 only).</p> <p>String concatenation is accomplished using the + symbol</p>
